Ω: every complete outcome
data $X(\omega) \in E = \{0,1\}^n$
statistic $\bar{R}_n(\omega)$
$\omega^*$
what happened
measure $X_i(\omega)$
$\omega^*$
1 0 0 1 1 0 1 0 0 1 1 1
1 1 1 1 0 0 1 0 1 1 1 1
1 1 1 0 1 1 1 1 1 1 0 1
1 0 1 1 0 1 1 1 0 1 1 0
1 0 1 1 1 1 1 1 0 1 0 1
1 1 0 1 1 1 1 1 0 1 0 1
0 0 1 0 0 0 1 1 1 0 1 1
⋮ one row per outcome, $2^n$ rows
compute $\frac{1}{n}\sum_i X_i(\omega)$
its distribution over all $\omega$, weighted by $\mathbb{P}_p$
0
$\bar{r}_n = 0.67$
1
inference runs backwards: hold the one value $\bar{r}_n$ up against the whole distribution of $\bar{R}_n$
