One observation's log-likelihood
$R=1$: $\log p$
$R=0$: $\log(1-p)$
average under p^* (black)
and the parabola with
its curvature (aqua)

p
Fisher information of one coin flip
$I(p) = 1/(p(1-p))$
minimum 4 at $p=\frac{1}{2}$
$I(0.645) = 4.37$
