Ω: every complete outcome
Data $R(\omega) \in E^n = \{0,1\}^n$
Statistic $\bar{R}_n(\omega)$
what happened
ω^*
measure $R_i(\omega)$
compute $\frac{1}{n}\sum_i R_i(\omega)$
its distribution over all ω, weighted by $\mathbb{P}_p$
⋮ one row per outcome, 2^n rows
0
$\bar{r}_n = 0.67$
1
inference runs backwards: hold the one value $\bar{r}_n$ up against the whole distribution of $\bar{R}_n$
